ART UNIT	PAPER NUMBER
----------	--------------

2135

DATE MAILED: 12/30/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)	
	09/720,085	GOUBIN ET AL.	
	Examiner	Art Unit	
	Linh LD Son	2135	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 20 December 2000.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 14-34 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 14-34 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. This Office Action is responding to the RCE received on 09/19/2005.
2. Claims 14-34 are pending. Claims 1-13 have been canceled.

Response to Arguments

3. Applicant's arguments and amended "electronic" term in claim 1 filed 08/19/2005 in regarding to the 35 U.S.C. 101 have been fully considered but they are not persuasive. The amended term "electronic" does not provide evidence that the mathematical operations have practical application in the technological arts. The 35 U.S.C. 101 rejection is maintained. See below.

Claim Rejections - 35 USC § 101

4. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

5. Claims 14-34 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter. The language of the claim raises a question as to whether the claim is directed merely to an abstract idea that is not tied to a technological art, environment or machine which would result in a practical application producing a concrete, useful, and tangible result to form the

basis of statutory subject matter under 35 U.S.C. 101. Claims 14-34 consist solely of mathematical operations without practical application in the technological arts or simply manipulate abstract ideas without practical application in the technological arts.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

7. Claims 14 is rejected under 35 U.S.C. 102(e) as being anticipated by Kocher et al, US/6304658B1, hereinafter "Kocher".

8. As per claim 14:

Kocher discloses "A method for verifying a signature, or respectively an authentication, utilizing an asymmetric private-key and public-key cryptographic calculation process between a "*prover*" entity and a "*verifier*" entity" in (Col 15 lines 30-45), said prover entity including electronic communication means for communicating with said verifier entity, wherein the prover entity performs first cryptographic calculations with said private key (d) to produce a signature calculation, or respectively an authentication

Art Unit: 2135

value, constituting response data (Col 15 lines 30-45, and Col 16 lines 28-52), and the verifier entity, based on said response data, performs second cryptographic calculations with said public key to perform said signature verification, or respectively said authentication (Col 15 lines 45-57), the first and second cryptographic calculations serving to implement the calculation of modulo-n or large-number multiplications, wherein the cryptographic calculation process uses said public key comprising a public exponent e and a public modulo n , and said a private key comprising a private exponent (Col 15 lines 30-45, and Col 16 lines 28-52), said method further comprising: calculating at the level of said prover entity at least one prevalidation value representing at least a quotient of a modulo calculation prevalidation value (m' , Col 17 line 45) representing at least a quotient of a modulo calculation in (The signing process, Col 16 lines 61-67, and Col 7 lines 30-55); using electronic communication means of the prover entity for transmitting to the verifier entity said response data comprising at least said prevalidation value (Col 21 lines 20-34), and utilizing said prevalidation value by the verifier entity to perform at least one modular reduction to obtain the remainder of the modulo calculation (The decrypting process, Col 16 lines 61-67, and Col 7 lines 30-55), “without any division operation at the level of the verifier entity” in (Col 17 lines 56-62, “Montgomery reduction is a technique which allows efficient implementation of modular multiplication without explicitly carrying out the classical modular reduction step”).

Claim Rejections - 35 USC § 103

9. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

10. **Claims 15-18, 21-27, and 31-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kocher in view of Blind Signature Schemes, (Menezes et al, Handbook of Applied Cryptography, Chapter 11.8.1 Pg 475), hereinafter "Menezes". (Cited in PTO 892 dated 05/18/05)**

11. As per claim 15:

Kocher teaches **"a method according to claim 14, wherein the cryptographic calculation process is based on a Rabin Algorithm"** in (Col 2 lines 35-47). Rabin Algorithm is an improvement of RSA, which is used to verify and authenticate a signature. As explained in Column 15 from lines 35-40, Party A wants to authenticate to Party B by calculating a signature encrypted using the secret key. $M = S^e \bmod n$ signature, then get transmit over to Party B for verification. However, Kocher does not teach the Quotient $Q = R^k/n$ or $Q = CA^k/n$ where $CA = R =$ signature and k is any integer. Nevertheless, the Quotient is a method of blinding the signature before sending it to the verifier. Instead of sending the signature to the verifier, the signature gets blinded by a process of k exponent and divides by an n factor. Since both the verifier and the prover

Art Unit: 2135

know the n value, the signature can be easily recovered by a simple multiplication of n . It is common to use the blinding signature method in the art to prevent ease-drop attack (See Blind Signature on Page 475). Therefore, it would have been obvious for one having ordinary skill in the art at the time of the invention was made to incorporate the blind signature method to calculate the pre-validation value before sending it to the partner. In addition, the blind signature method would not be a burden on the smart card side, since the heavy calculation processing has already been done on the card reader side.

12. As per claim 16:

The blinding signature method is incorporated. Further, the RSA signature verification method is also included to verify the message authenticity taught in (Kocher, Col 19 lines 1-22). Based on the RSA signature verification algorithm, the verification is concluded when both the sent signature and the decrypted signatures are equal or the difference is zero. The $(D_{AR}, D_{SR}) = R * R = Q * n$ equation does just that.

13. As per claim 17:

Claim 15 is incorporated. However, the Quotient $Q2$ is not directly taught.

Nevertheless, $Q2$ equation is formulated to $R * (R * R - Q1 * n) / n$ so that the result of the signature verification is equal to Zero. This verification method is common in art and also taught by the RSA (Col 2 lines 35-47). The verification process is concluded when the decrypted message is the same as the sent message or another word the difference of the messages equals to zero. In additional, the blind signature method is also

Art Unit: 2135

implemented in the formulation of Q_2 (See Claim 15 basis of rejection using the blind Signature), where the equation is divided by n . Therefore, it would have been obvious for one having ordinary skill in the art at the time the invention was made to incorporate the blind signature and the RSA signature verification method into Kocher's invention to reduce the processing burden on the Smart card processor which is limited.

14. As per claim 18:

The blinding signature and the RSA signature verification method described in claims 15, 16 and 17 are also applied.

15. As per claims 21 and 22:

Kocher discloses **"A method according to claims 16 and 18, characterized in that, for an authentication verification operation, said method further comprises the step for transmitting a prompt value from the verifier entity to the prover entity"** in (Col 15 lines 35-40). The prompt value in Col 15 lines 35-40 is the message M , which is not limited to the text message. The message must be originated from party B in order to verify the received message is the same as the original.

16. As per claims 23 and 24:

Kocher discloses **"A method according to claims 21 and 22, characterized in that said prompt value comprises a random value d modulo n , said response value M comprises an encrypted value B , and said function of the response value comprises a function $f(A)$ of said random value d "** in (Col 15 lines 35-40). As rejected in claims 21 and 22, the $f(A)$ is recited as $f(M) = M^d \bmod n$.

Art Unit: 2135

17. As per claims 25-27:

Kocher discloses **"A method according to claims 16 and 21-22, characterized in that said function $f(A)$ if said random value A comprises a function among the functions $f(A)=A$ "** in (Col 15 lines 35-40). The function taught is $M^d \bmod n$. If $n = 1$ and $d=1$, then $f(A) = A$. However, the " $f(A)=n-A$, $f(A)= C*A \bmod n$, $f(A)= -C*A \bmod n$ " is not taught by Kocher. Nevertheless, the result of the $f(A)$ is depending on a mathematical functions $f(A \bmod n)$. Therefore it would have been obvious at the time of the invention was made for one having ordinary skill in the art to implement plurality of different mathematical functions to acquire different results to add more verification steps of the signature.

18. As per claims 31 and 32:

Kocher discloses **"A method according to claim 23, characterized in that said function $f(A)$ of said random value A is the function $f(A)=A$, which makes it possible to verify the equality of said difference and the validity of said authentication without any division operation for the modular reduction"** in (Col 15 lines 35-40, and Col 17 lines 30-65). Montgomery's reduction is an arithmetic reduction performing without any division operation (Col 17 lines 60-65).

19. **Claims 28-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kocher in view of Menezes, and further in view of Stinson, Cryptography theory and Practice, CRC Press, Inc. page 3, hereinafter "Stinson". (Cited in PTO 892 dated 09/08/04)**

20. As per claims 28, 29, and 30:

Kocher and Menezes do not clearly teach **"a method according to claim 25, 26, and 27, respectively characterized in that at the level of the verifier entity, the calculation of said function $f(A)=C*A \bmod n$ comprises calculation of the value $C*A$ and storing of said value if $C*A < n$, and the calculation and storing of the value $C*A - n$ if not, and in that calculation of said function $f(A) = -C*A \bmod n$ comprises calculation of the value $n-C*A$ and storing of said value if $n-C*A \geq 0$, and otherwise calculation of the intermediate value $C*n-C*A$, and if said intermediate value is greater than or equal to zero, calculation and storing of the value of $-C*A \bmod n$, for verifying the equality of said authentication without any division for the modular reduction"**. Nevertheless, the modular reduction method in the claim is the basic mathematic of modular reduction comprise of multiplication and subtraction only. The same method is explained in Stinson on page 3, (the definition 1.2). The C is similar to q_1 and r_1 is the remainder of a division of m by b . The checking of the difference less than or equal to 0 is to find out the arithmetic completed or not. Therefore, it would have been obvious at the time of the invention was made for one having ordinary skill in the art to implement the modular reduction method without any division by trying number of variables until the remainder is found.

The method would require minimal processing capacity given that n is not sufficiently large.

21. **Claims 19 and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kocher in view of Menezes, and further in view of Poore et al, US Patent No. 6202933B1, hereinafter "Poore". (Cited in PTO 892 dated 09/08/04)**

22. As per claims 19 and 20:

Kocher and Menezes do not disclose, **"the applying a condensation function to said message to obtain a message digest CM; and concatenating said message digest with a constant value "**. Nevertheless, the feature is taught clearly by Poore in (Col 4 lines 52-56). Therefore, it would have been obvious at the time of the invention was made for one having ordinary skill in the art to modify the invention to include Poore's teaching so that the signature is further be verified by using its digest.

23. **Claim 33 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kocher in view of Poore et al, US Patent No. 6202933B1, hereinafter "Poore". (Cited in PTO 892 dated 09/08/04)**

24. As per claim 33:

The encrypted value B , and a quotient value Q in claims 14, 15, and 17 is incorporated. However, Kocher does not teach the concatenation of the two values. Nevertheless, it is taught in Poore in (Col 4 lines 52-56). Therefore, it would have been

Art Unit: 2135

obvious at the time of the invention was made for one having ordinary skill in the art to combine Poore's teaching to add a security feature to the message transferring process.

25. Claim 34 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kocher in view of Liskov et al, US Patent No. 6411715B1, hereinafter Liskov. (Cited in PTO 892 dated 09/08/04)

26. As per claim 34:

Kocher does not disclose "a method according to claim 14, **wherein the verifier entity compression embedded system such as a microprocessor card and the prover entity comprises an embedded card reading system**". Nevertheless, Liskov teaches a method and apparatus for verifying the cryptographic security keys where the authentication process is utilized in microprocessor card and a card reading apparatus (Col 7 lines 5-15, Col 6 lines 50-65). Therefore, it would have been obvious at the time of the invention was made for one of ordinary skill in the art to incorporate Kocher's teaching in the smart card technology to reduce the processing power and time which is limited in the technology.
